#### E2E Consolidated data flow

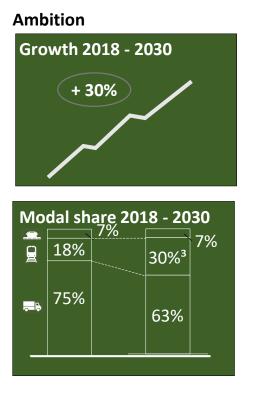

# *...THIS WILL ENABLE TO SCALE-UP As a company but also as a sector*

Impact of modal shift on additional freight transport 2030 vs. 2018

in bn ton-km; EU 28 + CH, N; excluding pipeline, sea and air

#### Levers

A. Continue **restructuring** and **modernisation** of RUs to achieve a competitive **cost base** and high resource **productivity** 

B. Increase quality, flexibility and ease of use of rail/ multi-modal products

C. Vigorously strengthen **innovation**, enhance speed of **digitisation** and deployment of available **technology** 

# In general data sharing can provide every stakeholders with a lot of value...

Increase speed of existing processes

Empower our staff

Improve quality of our processes

Improve safety level

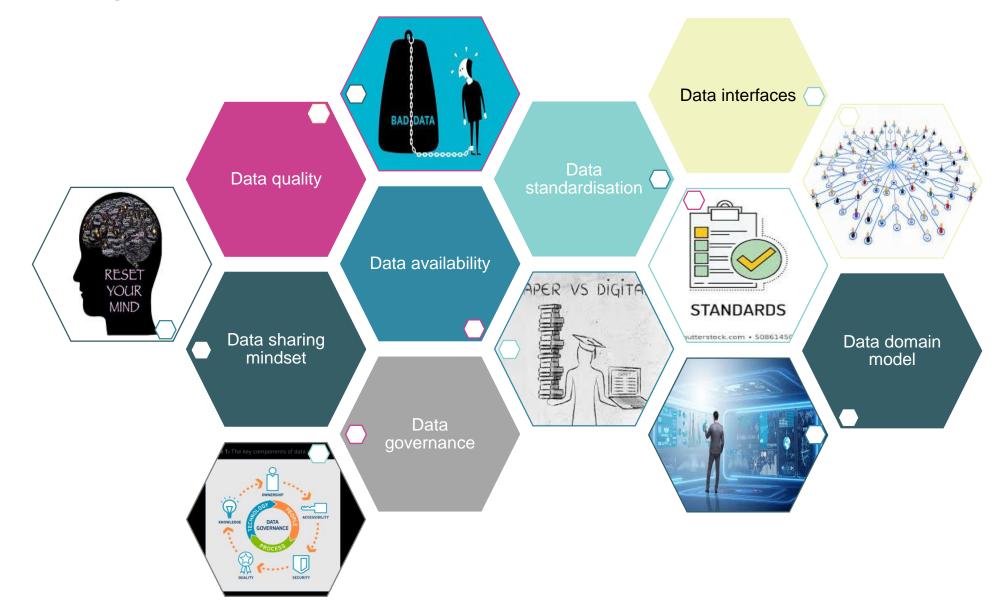

Reduce operating costs

Constantly improve ourselves

# ... in order to capture this value we need to address different challenges.

LINEAS

#### Data sharing mindset

What do we read currently?

□ Threshold is often high to start sharing data often due to overestimation of value of existing data

- □ Value provided by integration of different data sources is often underestimated
- □ This can be managed
  - □ by clear data governance rules ensuring usage & data visibility only to appropriate users
  - □ enforcing data sharing by European laws or regulation

We believe that standardized and qualitative data exchange is a major enabler of our modal-shift vision

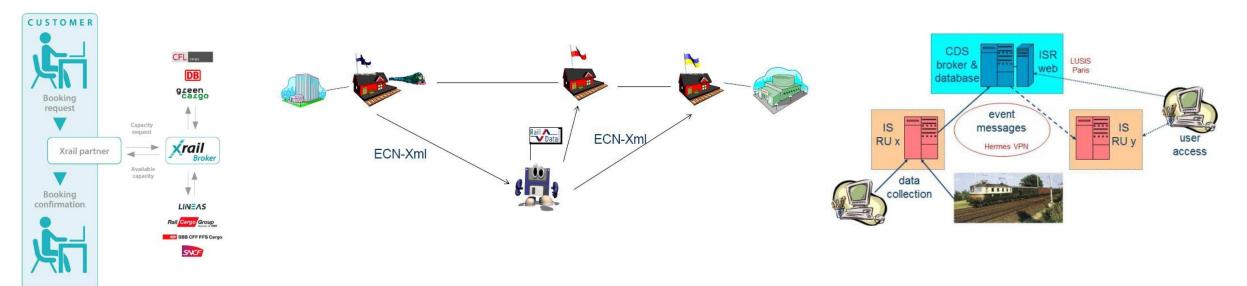

Data sharing

mindset

#### Data sharing mindset

What is our sector doing?

- Rail has historically always been aware of the important network nature of its business.
- Different solutions therefore exist to exchange operational data of:
  - Bookings via XRAIL
  - Transmission of consignment notes via Orfeus
  - Exchange of Track & Trace information via ISR, RNE-TIS, ....
- The main challenges is now to integrate smaller players with much lighter IT systems: Some initiatives are taken but could be speeded-up
  - RailData WDI : Delivery & Hand-over messages

•

### Data availability

#### Rail has still a lot of paper documents that need to be filled in ...

#### Data availability

... part of them are also inserted afterwards into IT systems , others not

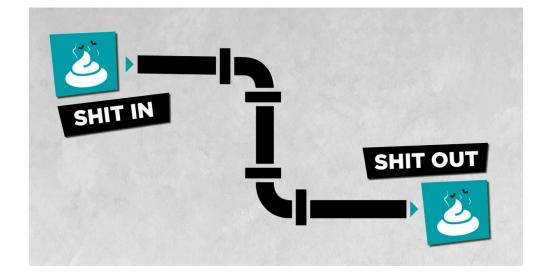

Data

availability

## Data quality

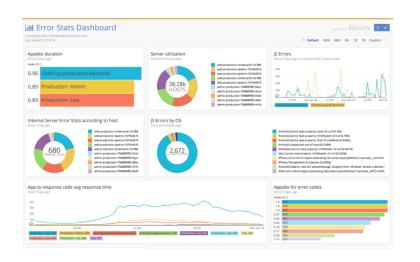

- In order to realize all the benefits, we need to have qualitative data to be able to automate operations.
- The level of quality expected is especially high for the daily operations but can be lower for high level reporting needs.
- The actual level of quality is highly dependent on the type of input : manual input, via sensoring, ...
- The focus on quality should be shared between the different data providers & consumers in order to continuously work on it.

# Data quality

- The different rail platforms are currently monitoring various KPIs regarding the data quality.
- The quality today is however not sufficient to fully automate our processes based on them. This is mainly due to the manual input of data
- The level of quality required is today not aligned between the different platforms.
- More qualitative sources such as GPS sensors on locomotives, wagons and rail infrastructure sensors, are being incorporated to fix the quality issues.

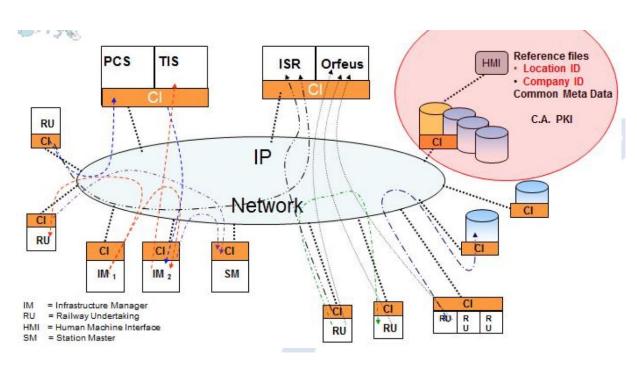

#### Data standardization

Specify what data to be exchanged

- The Technical Specification for Interoperability on "Telematics Applications for Freight" (TAF TSI) drafted by ERA prescribes protocols for the data exchange of:
  - Path Request
  - Train Running Forecast
  - Service Disruption Information
  - Shipment Estimated Time of Interchange / Arrival
- TAF TSI prescribes furthermore databases which must be implemented by European RUs, IMs or Freight Customers:
  - Reference Files (such as location ID, company ID etc.).
  - Rolling Stock Reference Databases
  - Wagon and Intermodal Unit Operational Database
  - Trip plan for wagon / Intermodal unit

#### But currently no reinforcement & a need for future proof revision

´ Data ` standa

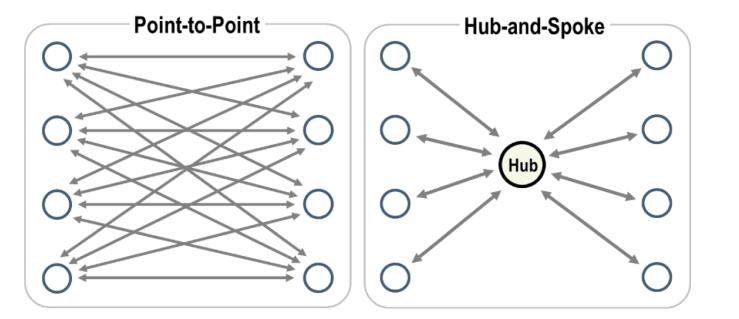

rdisatio

LINEAS

#### Data interfaces

- Most of rail interfaces are done via Hub and Spoke system for the operational part between RUs.
- The link with customers, terminals and infrastructure managers has historically always be more point to point.
- We now see trends towards a more Hub and spoke system via different overarching 'neutral' platforms.

#### Data domain model

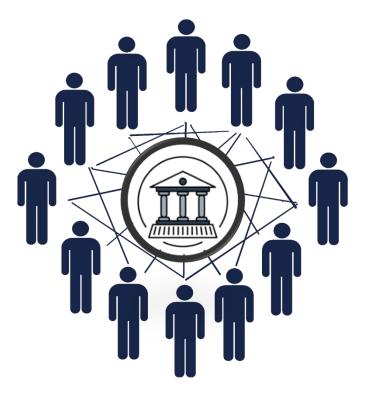

- We today have different pieces of the data puzzle: reference data about our assets, operational data for running trains, ... covered by different data sharing platforms
- In order to fully achieve our objectives, it's important to be able to have the aggregate view of the Rail domain
- It's therefore crucial that standardization across data platforms is realized and potential gaps are filled.

- In a data sharing context, the integrity and security of the data are of prime importance.
- Uploading operational data on a shared platform should come with a guarantee that it is only accessible to authorized people and for a well defined purpose.
- This governance should be supported by the data platforms along with the data providers themselves.
- This is the key to build trust around data

#### **Conclusion** Are where there yet?

- We are today putting a lot of energy on data availability for the smaller RU's in order to be able to give qualitative E2E service towards our customers
- It's a real challenge to align and work together on improving the data quality in order to enhance cross-companies processes.
- Steps are being taken about standardization but deployment is slow and not spread across the complete industry
- We still have a big amount of work to make all this data exchange multimodal
- As a sector we have to overcome our anxiety about data sharing because it will enable us to bake a much bigger pie to share with one another than the one we are currently fighting for
